

## TECHNICAL ASSIGNMENT

# Sales Meeting & Visit Management System

---

*Full-stack engineering exercise*

| Suggested effort | Primary focus        | UI polish |
|------------------|----------------------|-----------|
| 6–8 hours        | Logic & architecture | Secondary |

## 1. Objective

Build a small application that allows a sales team to schedule customer visits, conduct meetings, record outcomes, and manage follow-up actions. The assignment is intentionally focused on business logic, data modelling, state transitions, permissions, validation, and maintainable code.

**Important:** We care more about your data model, business logic, code structure, reasoning, and handling of edge cases than visual polish.

## 2. User Roles

- Sales Employee — manages their own meetings, performs check-in/check-out, records outcomes, and handles follow-ups.
- Sales Manager — can view their team's activity and perform manager-level actions such as reopening a completed meeting.
- Admin — has broader access for administration and oversight.

## 3. Core Functionality

A sales employee should be able to create a meeting against a customer/account. At minimum, capture:

- Customer/account and contact person
- Meeting purpose
- Scheduled start and end time
- Meeting location
- Assigned sales employee
- Notes

The employee should be able to check in when the meeting begins and check out when it finishes. Capture the relevant timestamps and location information. On completion, the employee must record an outcome.

Suggested meeting outcomes:

- Interested
- Follow-up required

- Proposal requested
- Not interested
- Unable to meet

Where a follow-up is required, the application should create or require a follow-up action with an owner and due date.

## 4. Meeting Lifecycle

Your implementation should support a meaningful meeting lifecycle rather than treating a meeting as simple CRUD.

**Scheduled → Confirmed → Checked In → In Progress → Completed**

## 5. Design Scenario — Deliberately Open-Ended

**Consider the following scenario carefully:**

*A salesperson checks into a customer meeting at 10:02 AM. The meeting was scheduled for 10:00–11:00 AM. At 10:40 AM, the customer asks them to return at 3:00 PM instead. The salesperson returns at 3:10 PM and completes the meeting at 4:00 PM.*

## 6. Technical Deliverables

- Working frontend and backend
- Database schema and migrations
- Authentication/authorization supporting the required roles
- Meeting lifecycle and business-rule implementation
- README with setup instructions and architecture overview
- ER diagram or a clear explanation of the database model
- API documentation or an endpoint list
- Automated tests covering at least 5 important business rules
- A short "Decisions & Trade-offs" section describing assumptions, shortcuts, and what you would change for production
